

United States Cancer Statistics

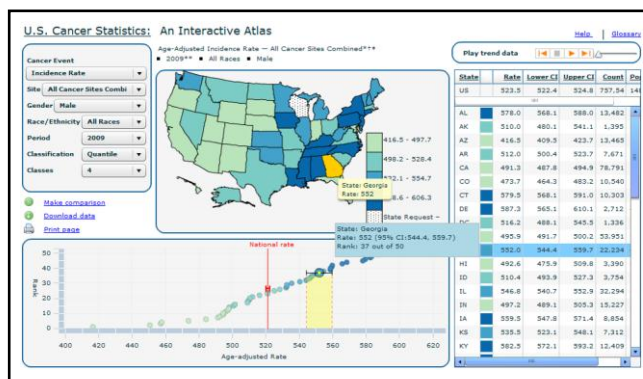

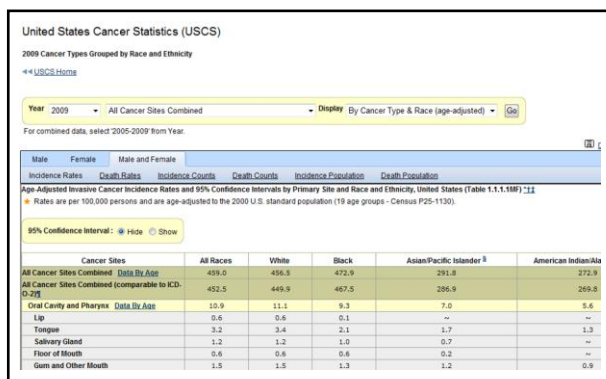

The *United States Cancer Statistics (USCS): 1999–2009 Incidence and Mortality Web-based Report* contains the official federal government statistics for cancer incidence (new cases) and mortality (deaths) in the United States. USCS includes incidence data from CDC's National Program of Cancer Registries and the National Cancer Institute's Surveillance, Epidemiology and End Results program, and mortality data from CDC's National Center for Health Statistics. The report is produced in collaboration with the North American Association of Central Cancer Registries.

The current report includes cancer cases diagnosed and cancer deaths that occurred from 1999 through 2009. Each year of data includes more than 1 million cases of invasive cancer, including about 14,000 cases among children younger than 20 years, and more than 500,000 deaths from cancer. The population coverage varies by diagnosis year. In 2009, cancer incidence data were obtained from central cancer registries in 49 states, 6 metropolitan areas, and the District of Columbia (covering 98% of the U.S. population), and cancer mortality data were obtained from all states and the District of Columbia (covering the entire U.S. population). These data are used to assess the cancer burden, inform and evaluate prevention efforts, and address disparities.

Online Tool

You can look at USCS data online at www.cdc.gov/uscs. National, regional, and state-specific cancer incidence and death data are available for each year from 1999 through 2009, and for 2005–2009 combined, by sex, age, race, ethnicity, geographic region, and cancer site.

You can make graphs, tables, or maps, and look at the age-adjusted rate per 100,000 population or the actual number of cases or deaths. The Interactive Cancer Atlas shows you how rates differ by state and how they change over time. You can save the data to your own computer or print a copy of the page.
